SCOPE

The journal publishes papers of a high standard covering the field of materials research related to nuclear science and technology. Original research and critical review papers concerned with the basic science and application of these materials in fission and fusion reactor systems, in fuel fabrication and fuel reprocessing plants and in the treatment and storage of nuclear waste will be welcome. The following list, which is not exhaustive, gives examples of topics covered by the journal.

- The properties, structure and irradiation behaviour of fissile fuels, moderator and control materials, first-wall materials, blanket materials, etc.
- The material aspects of the fabrication and reprocessing of fuels.
- The structure and properties of structural materials used in nuclear plants including corrosion and mechanical properties and the related topics of structural integrity and life prediction methods and the safety of nuclear plants.
- The fundamental mechanisms and applied aspects of irradiation damage in materials including metals and alloys, ceramics, polymers and materials used for magnets, solid state devices, insulation coatings, etc.
- Materials used in the treatment and storage of nuclear waste.

INSTRUCTIONS TO CONTRIBUTORS

Contributions may be written in English, French or German, and should be submitted *in duplicate* to one of the Editors, either directly or through a member of the Advisory Editorial Board.
The Editors may at their discretion submit contributions to referees. The submission of a contribution will be taken to imply that the author has satisfied himself that no copyright will thereby be infringed.
Submission of a paper to any of the Editors will be taken to imply that permission to publish has been given by the appropriate authorities. Neither the Editors nor the Publisher can accept any responsibility in this respect.

Abstracts should be written in the language of the contribution or, preferably, in English. The abstract should be on a separate sheet (complete with the title and names of the authors).
Abstracts should not exceed a total length of 150 words. Longer abstracts will be shortened by the Editors if necessary, without consulting the authors.

Manuscripts should be typewritten on one side of the paper only, with double spacings and wide margins. Only first copies and clear xerographic prints thereof are acceptable to the printers.

Headings and subheadings should be typed in lower case except for the initial capital letter.

Displayed formulae should be numbered and typed or *clearly* written by hand. Vectors will be printed in ***boldface italics*** (heavy, slanting type), and should be indicated by a wavy underlining in the typescript.
Otherwise no symbols should be underlined. Special attention should be paid to the clear distinction of characters which can easily be misread such as i (lower case), I (cap.), l (el), 1 (one), ′ (prime); o (lower case), O (cap.), 0 (zero); u, v (lower case), ν (greek nu), V (cap.); s, S; x, X, ×; p, P, ρ (Greek rho); etc. If necessary, unusual symbols should be explained in pencil in the margin.

Units and symbols: the use of metric units in the SI (Système Internationale) form is *obligatory*. Potential contributors are referred to the detailed editorial announcement on this matter published in the Journal of Nuclear Materials 73 (1978) 2. Reprints of this announcement can be obtained from any of the Editors or Editorial Advisers.

Tables should be typed on separate sheets, and should have a title in addition to their serial number; their desired location should be indicated in the margin of the text.

Figures: line drawings should be originals, drawn in black India ink or (preferably not) glossy prints of good quality. Xerox copies are *not* acceptable. Figures should be drawn in such a way that they can be reduced to a final width of 76 mm (i.e. the column width); in exceptional cases a reduction to a width of 160 mm (two columns) will be allowed. All the lettering (numerical scales, scale and curve legends, etc.) as well as the details (e.g. graph symbols) should be such that a height of 1.5–1.8 mm results after reduction. The lettering should be done with a lettering guide (stencil) or using stripletters (Letraset, etc.). Each figure should have a number and a caption. The captions should be typed on a seperate sheet. The desired location of figures should be indicated in the margin of the text. Photographs should be unmounted, unless they form part of a composite figure, and be richer in contrast than is desired in the printed version. Only original ink drawings and photographs will be returned after publication of the paper.

Colour plates: Illustrations can be printed in colour when they are judged by the Editor to be essential to the presentation. Further information concerning colour illustrations and the costs to the author can be obtained from the Editors or the Publisher, or found at the beginning of Volume 148.

References to published literature should be quoted in the text by the name of the author followed by a number in square brackets in the sequence of citation. The references should be listed at the end of the typescript as in the following examples: [1] for a paper in a journal, [2] for a book, [3] for a paper in a Conference Proceeding, [4] for a paper in a contributed volume, [5] for a report of a laboratory:

Footnotes should be avoided as far as possible.

Rapid publication: short manuscripts (not exceeding a total length of 2000 words) which have been entitled: "Letter to the Editors" by the author(s) will be published directly, without sending proofs to the author(s). Letters to the Editors require no abstract.

Corrections in the proofs should be limited to printer's errors; owing to the time-consuming and expensive work involved, any other changes in the proofs may be charged to the authors. They should therefore check their manuscript carefully for typographical errors and small inconsistencies. The submitted paper should be in final form.
Alterations in abstracts are not acceptable at proof stage and will be ignored unless approved by one of the Editors.

Page charge and reprints: there will be no page charge. Reprints may be ordered from the publisher. An order form will be sent to contributors together with the proofs. 25 reprints of each article will be supplied free of charge.

Books for review should be offered or sent to one of the Editors.

News or announcements should be submitted in duplicate to one of the Editors.

Upon acceptance of an article the author(s) will be asked to transfer copyright of the article to the publisher. This transfer will ensure the widest possible dissemination of information.

No responsibility is assumed by the Publisher for any injury and/or damage to persons or property as a matter of products liability, negligence or otherwise, or from any use or operation of any methods, products, instructions or ideas contained in the materials herein. Although all advertising material is expected to conform to ethical standards, inclusion in this publication does not constitute a guarantee or endorsement of the quality or value of such product or of the claims made of it by its manufacturer.

Thermodynamic Properties of Inorganic Materials

A Literature Database Covering the Period 1970-1987

by **B. Cheynet,** *Thermodata, Saint Martin d'Heres, France*

(Physical Sciences Data, 38A & B)

This work offers easy and rapid retrieval of information on inorganic thermochemistry. It comprises two separate volumes containing over 25,800 references covering more than 13,400 chemical systems. The chemical systems are listed in Part A both in terms of the title of the papers in which they are discussed and as keywords defining the system of interest in terms of the elements, e.g. F-Rb-Sc. The corresponding full references to the papers are given in Part B. The references encompass all the thermodynamical properties of inorganic compounds, gases, metals, alloys and solutions.

The literature on thermodynamics is a rich one, particularly on inorganic thermochemistry which is of fundamental importance to the understanding and improvement of materials and to the development of new materials. This new compilation will therefore be extremely useful for all those working in inorganic chemical engineering in the broadest sense: metallurgists, materials scientists, ceramicists, geologists, chemists, physicists or engineers involved in the treatment of thermochemical properties of compounds, gases, metals, alloys or inorganic solutions.
